# Peeking into Your App without Actually Seeing It: UI State Inference and Novel Android Attacks

**Qi Alfred Chen**, Zhiyun Qian†, Z. Morley Mao University of Michigan, †University of California - Riverside

# Importance of GUI Security

- GUI content confidentiality and integrity are critical for end-to-end security
  - UI Spoofing in desktop/browsers¹
  - Screenshot capture on Android without privilege<sup>2</sup>

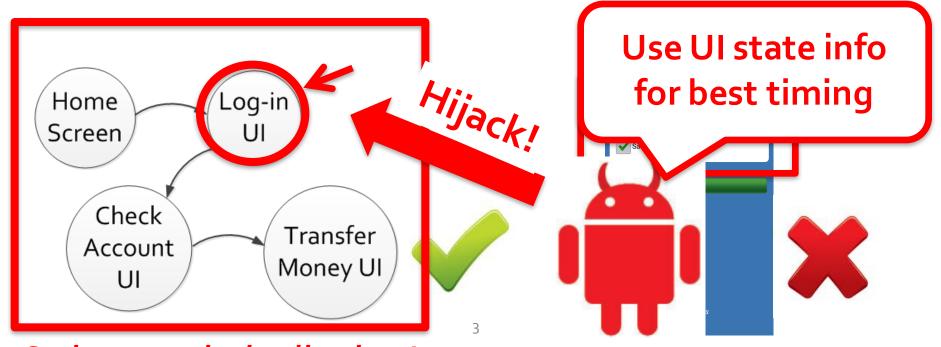

¹Chen, Oakland'07

<sup>2</sup>ScreenMilker, NDSS'14

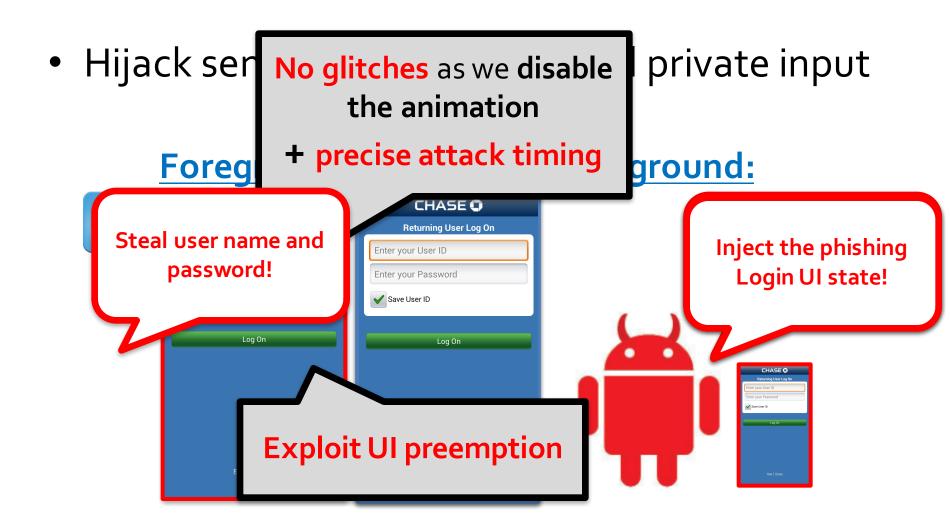

#### Another Form of GUI Confidentiality Breach

- A weaker form
  - UI state an app is in (e.g., login state) without
    knowing the exact pixels of the screen

Serious security implications!

# Enabled Attack: UI State Hijacking

# UI State Hijacking Attack Demo

 Video demo: UI state hijacking attack steals your password in H&R Block app

#### Other Enabled Attacks

- An enabled attack: camera peeking
  - Steal <u>sensitive pictures</u> taken in Android apps

- Breaks GUI confidentiality!
- Monitor and analyze user behavior
  - Breaks GUI confidentiality!
- Enhance existing attacks in both stealthiness and effectiveness

### UI State Leakage is Dangerous

- Lead to both GUI integrity and confidentiality breaches
- UI state information is not protected well
  - An unprivileged application can track another app's UI states in real time

#### UI State Inference Attack

- UI state: a mostly consistent UI at window level for certain functionality (e.g., log-in)
  - On Android: Activity (full-screen window)
- Also called Activity inference attack
  - An unprivileged app can infer the foreground Activity in real time
  - Requires no permission

# **Underlying Causes**

- Android GUI framework design leaks UI
  state changes through a publicly-accessible
  side channel
  - A newly-discovered shared-memory side channel
  - Affects nearly all popular OSes

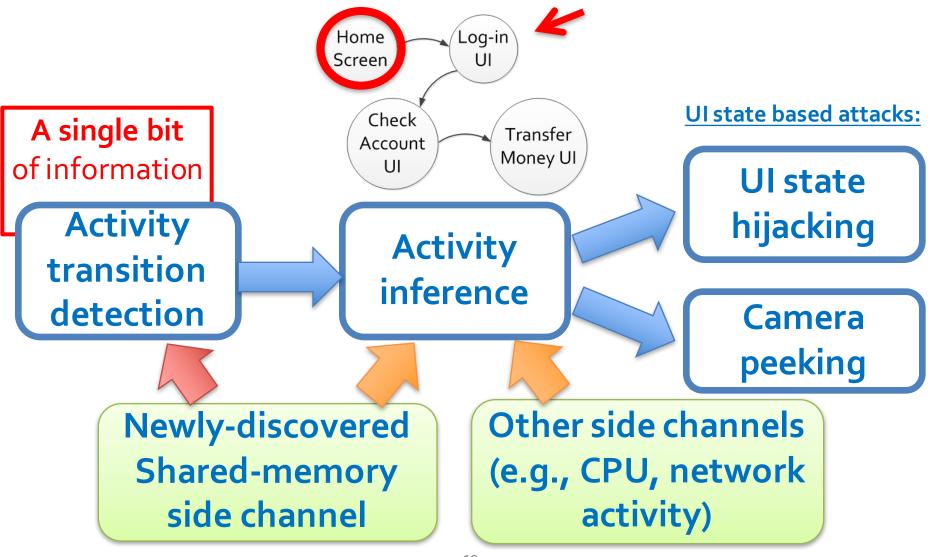

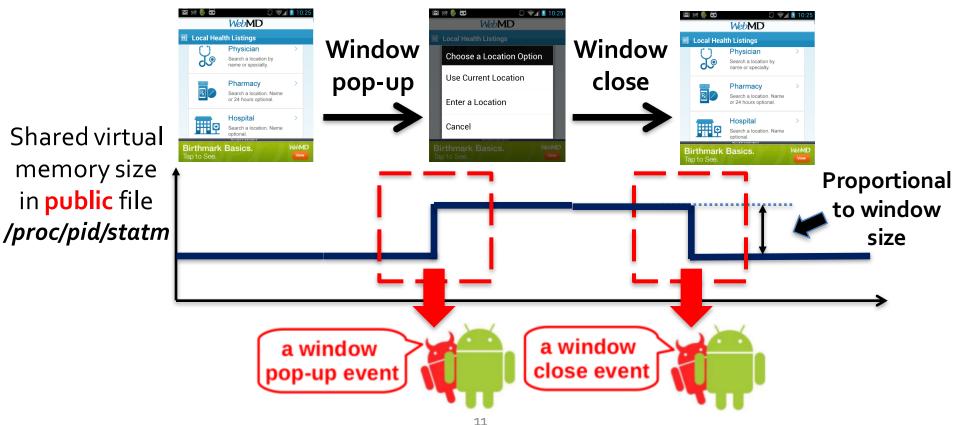

### Attack General Steps

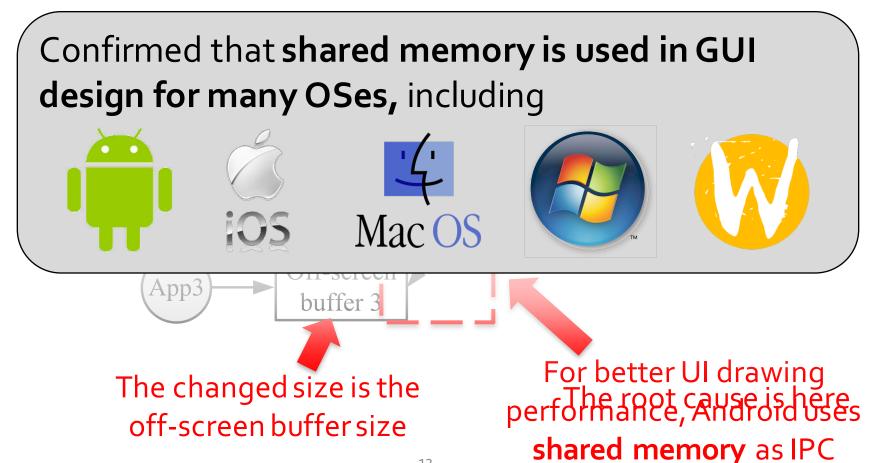

# Shared-Memory Side Channel

• **Finding**: shared virtual memory size changes are correlated with Android window events

# Shared-Memory Side Channel

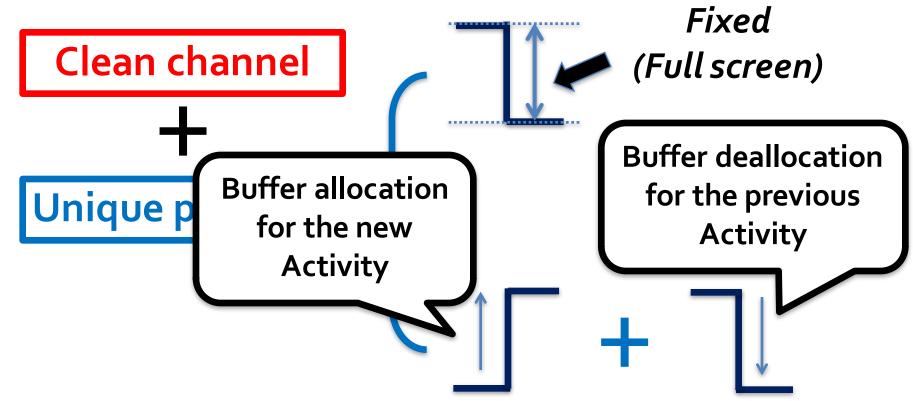

Root cause for this correlation

### **Activity Transition Detection**

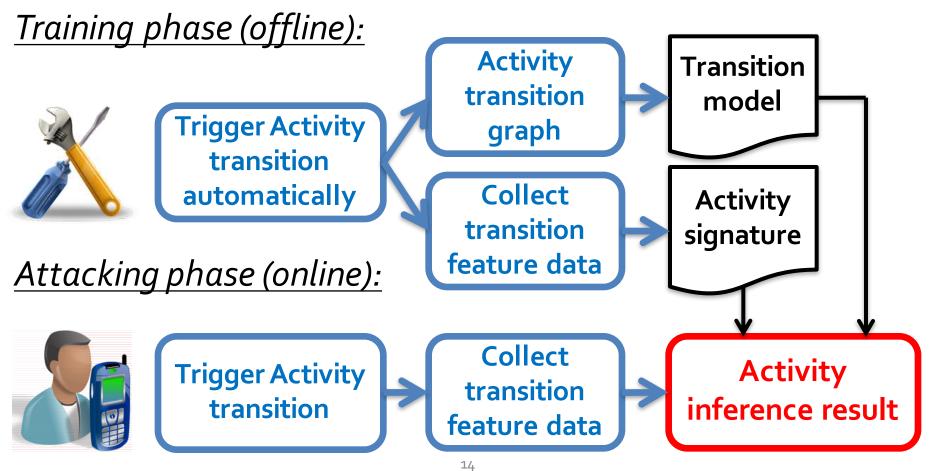

Detect shared-memory size change pattern

– Nice properties:

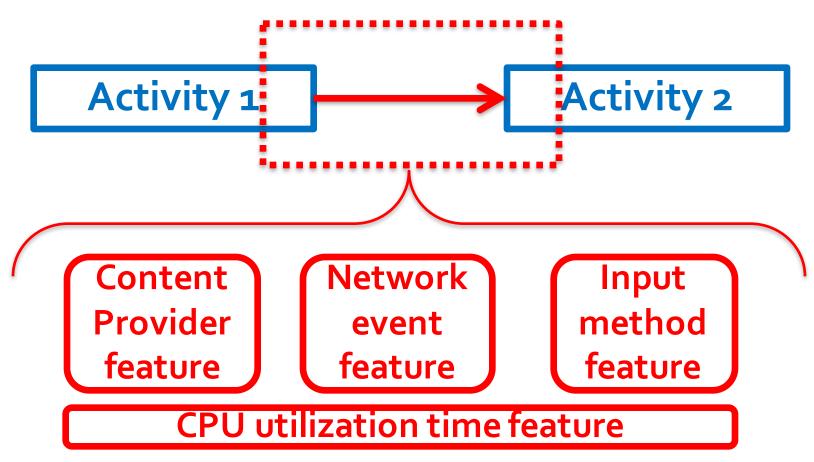

# **Activity Inference**

Activity signature + Activity transition graph

### Activity Signature Design

Consists of various features

#### Remaining Steps of Activity Inference

#### Create an Activity transition model

Hidden Markov Model (HMM)

#### Inference results

A list of Activities in decreasing order of their probabilities

### **Evaluation Methodology**

- Implementation: ~ 2300 lines of C++ code compiled with Android NDK
- Data collection: using automated Activity transition tool on Samsung Galaxy S<sub>3</sub> devices with Android 4.2
- Experimented on 7 popular Android apps:

#### **Evaluation Results**

- Activity transition detection, for all apps
  - Detection accuracy ≥ 96.5%
  - FP and FN rates both ≤ 4%
- Activity inference accuracy
  - 80—90% for 6 out of 7 popular apps
    - Important features: CPU, network, transition model
- Inference computation & delay
  - Inference computation time: ≤ 10 ms
  - Delay (Activity transition → inference result): ≤ 1.3 sec
    - Improved to ≤ 500 ms for faster and more seamless Activity hijacking
- Overhead
  - Increase power usage by 2.2–6.0%

#### **Defense Discussion**

- Eliminate the side channel
  - Proc file system access control
    - Android already limits some, but more is needed
  - Window buffer reuse
    - Pre-allocate double the buffers and reuse them
    - More memory consumption (<u>several MBytes per buffer</u>)
- Mitigate those follow-up attacks
  - For example, for UI state hijacking
    - Build trusted paths between user and app
- Defense is non-trivial, more effort is required

### Summary

Demonstrated serious security implications for a new form of GUI confidentiality breach

- Formulated a general UI state inference attack
  - Infer UI state in real time
- Discovered a new side channel for UI state inference
  - Potentially affecting all popular GUI systems
- Designed and implemented it on Android, and further built several new attacks (e.g., UI state hijacking)
- Attack video demos at our website
